

CARE INSTRUCTIONS SHELF - SMOKED OAK

Apply linseed oil 4 times the first month and afterwards from time to time.

It will close the surface and make the top more sturdy.

Alternatively, use beeswax to treat and protect the smoked oak veneer.

Do not wipe with a wet cloth.

INFO ABOUT SMOKED OAK

Smoked oak can only be produced because oak contains the active substance tannin by nature. The natural tannin content is determined by numerous factors such as climate during the growth phase and by soil conditions.

The natural tannin content reacts with ammonia during the smoking process and darkens the oak. The degree of discolouration therefore depends on the oak's natural tannin content on the one hand and on the duration of the smoking process on the other. The colour variation of the smoked oak is therefore an authentic characteristic.
